Vector Spaces

A vector space V is closed under vector Linear transformations: addition and scalar multiplication:

$$u + v \in V$$
 and $ku \in V$.

a subspace of V if W is itself a vector rotation. space. The intersection of subspaces is also a subspace of V.

S is linearly independent (LI) if

$$k_1 \boldsymbol{v}_1 + k_2 \boldsymbol{v}_2 + \dots + k_n \boldsymbol{v}_n = \boldsymbol{0}$$

has $k_i = 0$.

S forms a **basis** for V if S spans V and S is LI.

Fundamental Subspaces

For $\mathbf{A} \in \mathbb{R}^{m \times n}$:

- $r = \operatorname{rank}(\mathbf{A}) = \dim(\mathcal{C}(\mathbf{A}))$
- $r = \operatorname{rank}(\mathbf{A}^{\top}) = \dim(\mathcal{C}(\mathbf{A}^{\top}))$
- $n-r = \text{null}(\mathbf{A}) = \dim(\mathcal{N}(\mathbf{A}))$
- $m-r = \text{null}(\mathbf{A}^{\top}) = \text{dim}(\mathcal{N}(\mathbf{A}^{\top}))$

row space and null space.

Orthogonality

The subspaces U and W of a vector space V are orthogonal subspaces iff

$$\forall \boldsymbol{u} \in U: \forall \boldsymbol{w} \in W: \boldsymbol{u}^{\top} \boldsymbol{w} = 0.$$

•
$$\boldsymbol{v}^{\top}\boldsymbol{v} = \left\|\boldsymbol{v}\right\|^2$$

The **orthogonal complement** of U:

$$U^{\perp} = \{ \forall \boldsymbol{u} \in U : \boldsymbol{v} \in V : \boldsymbol{v}^{\top} \boldsymbol{u} = 0 \}$$

- $(U^{\perp})^{\perp} = U$
- $\dim U + \dim U^{\perp} = \dim V$
- $(\mathcal{C}(\mathbf{A}))^{\perp} = \mathcal{N}(\mathbf{A}^{\top})$
- $(\mathcal{C}(\mathbf{A}^{\top}))^{\perp} = \mathcal{N}(\mathbf{A})$

Projections:

$$\operatorname{proj}_{\boldsymbol{a}} \boldsymbol{b} = \boldsymbol{a} \boldsymbol{x} = \boldsymbol{a} \frac{\boldsymbol{a}^{\top} \boldsymbol{b}}{\boldsymbol{a}^{\top} \boldsymbol{a}}$$

$$\forall \boldsymbol{w} \in W : \boldsymbol{w} \neq \boldsymbol{p} :$$

$$\operatorname{proj}_W oldsymbol{b} = oldsymbol{A} \hat{oldsymbol{x}} = oldsymbol{A} oldsymbol{A} oldsymbol{a} + oldsymbol{A} oldsymbol{A} oldsymbol{a} - oldsymbol{p} oldsymbol{\|} oldsymbol{b} - oldsymbol{p} oldsymbol{\|} + oldsymbol{b} oldsymbol{-b} oldsymbol{A} oldsymbol{T} oldsymbol{b} - oldsymbol{p} oldsymbol{\|} + oldsymbol{A} oldsymbol{T} oldsymbol{b} - oldsymbol{p} oldsymbol{\|} + oldsymbol{b} oldsymbol{A} oldsymbol{T} oldsymbol{b} - oldsymbol{p} oldsymbol{\|} + oldsymbol{D} oldsymbol{\|}$$

Determinants

$$\det(\mathbf{A}) = \sum_{j=1}^{n} a_{ij} C_{ij} = \sum_{i=1}^{n} a_{ij} C_{ij}$$

where
$$C_{ij} = (-1)^{i+j} M_{ij}$$
.

$$\boldsymbol{A}^{-1} = \frac{1}{\det \boldsymbol{A}} \operatorname{adj} \left(\boldsymbol{A} \right)$$

where $\operatorname{adj}(\boldsymbol{A}) = C$

Linear Maps

$$T: V \to W \iff \forall u, v \in V: \forall k \in \mathbb{R}:$$

$$T\left(\boldsymbol{u}+\boldsymbol{v}\right)=T\left(\boldsymbol{u}\right)+T\left(\boldsymbol{v}\right)\wedge T\left(k\boldsymbol{u}\right)=kT\left(\boldsymbol{u}\right)$$

A $subset\ W$ of a vector space V is called **Rotations**: Anticlockwise looking down from the positive direction of the axis of

$$\boldsymbol{R}_{x} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\left(\theta\right) & -\sin\left(\theta\right) \\ 0 & \sin\left(\theta\right) & \cos\left(\theta\right) \end{bmatrix} \quad \boldsymbol{R}_{y} = \begin{bmatrix} \cos\left(\theta\right) & 0 & \sin\left(\theta\right) \\ 0 & 1 & 0 \\ -\sin\left(\theta\right) & 0 & \cos\left(\theta\right) \end{bmatrix}$$

$$\boldsymbol{R}_z = \begin{bmatrix} \cos\left(\theta\right) & -\sin\left(\theta\right) & 0 \\ \sin\left(\theta\right) & \cos\left(\theta\right) & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \boldsymbol{R} = \begin{bmatrix} \cos\left(\theta\right) & -\sin\left(\theta\right) \\ \sin\left(\theta\right) & \cos\left(\theta\right) \end{bmatrix}.$$

Shears:

$$m{S}_x = egin{bmatrix} 1 & a & b \ 0 & 1 & 0 \ 0 & 0 & 1 \end{bmatrix} \quad m{S}_y = egin{bmatrix} 1 & 0 & 0 \ a & 1 & b \ 0 & 0 & 1 \end{bmatrix} \quad m{S}_z = egin{bmatrix} 1 & 0 & 0 \ 0 & 1 & 0 \ a & b & 1 \end{bmatrix}$$

where the standard basis vector in the subscripted axis maps to itself. Think about where the standard basis vectors maps.

Reflections:

$$\boldsymbol{M}_{xy} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix} \quad \boldsymbol{M}_{xz} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \boldsymbol{M}_{yz} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Row equivalent matrices have the same where vectors are reflected across the plane formed by the subscripts of M. **2d reflections** about y = mx + c, where $\theta = \arctan(m)$:

$$\begin{split} T\left(\boldsymbol{v}\right) &= \boldsymbol{R} \boldsymbol{M}_{xz} \boldsymbol{R}^{-1} \left(\boldsymbol{v} - \begin{bmatrix} 0 \\ c \end{bmatrix} \right) + \begin{bmatrix} 0 \\ c \end{bmatrix} \\ &= \begin{bmatrix} \cos\left(\theta\right) & -\sin\left(\theta\right) \\ \sin\left(\theta\right) & \cos\left(\theta\right) \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} \cos\left(\theta\right) & -\sin\left(\theta\right) \\ \sin\left(\theta\right) & \cos\left(\theta\right) \end{bmatrix}^{-1} \left(\boldsymbol{v} - \begin{bmatrix} 0 \\ c \end{bmatrix} \right) + \begin{bmatrix} 0 \\ c \end{bmatrix} \\ &= \frac{1}{1+m^2} \begin{bmatrix} 1-m^2 & 2m \\ 2m & m^2-1 \end{bmatrix} \left(\boldsymbol{v} - \begin{bmatrix} 0 \\ c \end{bmatrix} \right) + \begin{bmatrix} 0 \\ c \end{bmatrix} \end{split}$$

Invariant Subspaces

Invariant (IV) subspaces:

For $T: V \to V$, \mathcal{V} is IV if

 $T(\mathcal{V}) \subseteq \mathcal{V} \iff \forall v \in \mathcal{V} \implies T(v) \in \mathcal{V}.$

Trivial IV subspaces:

- 1. V
- 2. $\operatorname{im}(T) \equiv T(V) = \{T(v) : v \in V\}$
- 3. $\ker(T) = \{ v \in V : T(v) = 0 \}$

Eigenspaces (1d IV subspace):

- 4. **{0**}
- 5. linear combination of IV subspaces

 $\mathcal{V} = \{ \forall \boldsymbol{q} \in \mathcal{V} : \exists \lambda \in \mathbb{C} : T(\boldsymbol{q}) = \lambda \boldsymbol{q} \}$

where λ_i are the eigenvalues of **A** and q_i are the eigenvectors of A, and they satisfy $(\mathbf{A} - \lambda \mathbb{1}) \mathbf{q} = \mathbf{0}$.

If **A** is invertible: $\det (\mathbf{A} - \lambda \mathbb{1}) = 0$.

Characteristic polynomial:

$$p_n\left(\lambda\right) = \det\left(\boldsymbol{A}_n - \lambda \mathbb{1}_n\right)$$

$$p_2(\lambda) = \lambda^2 - \operatorname{Tr}(\mathbf{A})\lambda + \det(\mathbf{A})$$

$$\operatorname{Tr}\left(\boldsymbol{A}\right) = \sum_{i=1}^{n} \lambda_{i} \quad \text{and} \quad \det\left(\boldsymbol{A}\right) = \prod_{i=1}^{n} \lambda_{i}$$

Similarity transformation:

$$m{A} o m{Q}^{-1} m{A} m{Q}$$

If q_i are LI, then A is diagonalisable:

$$\Lambda = Q^{-1}AQ \iff A = Q\Lambda Q^{-1}$$

If A is diagonalisable:

$$oldsymbol{\Lambda} = egin{bmatrix} \lambda_1 & & & & & \\ & \lambda_2 & & & \\ & & \ddots & & \\ & & & \lambda_n \end{bmatrix} \quad oldsymbol{Q} = egin{bmatrix} | & | & | & | \\ q_1 & q_2 & \cdots & q_n \\ | & | & | & | \end{bmatrix} \ & \ orall k \in \mathbb{N}_0 : oldsymbol{A}^k = oldsymbol{Q} oldsymbol{\Lambda}^k oldsymbol{Q}^{-1} \end{aligned}$$

The eigenvalues of A^k are the eigenvalues of A to the k-th power: $\lambda_1^k, \lambda_2^k, \ldots, \lambda_n^k$ The eigenvectors of \mathbf{A}^k equal the eigenvectors of \mathbf{A} .

Differential Equations

The ordinary differential equation (ODE): x' = ax, has the solution: $x(t) = c_1 e^{at}$. c_1 is determined through initial conditions.

The system of differential equations:

$$\begin{cases} x_1' = a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \\ x_2' = a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \\ \vdots & \vdots & \vdots \\ x_n' = a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n \end{cases}$$

$$\iff \frac{\mathrm{d}}{\mathrm{d}t} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$$

$$\iff \mathbf{x}' = \mathbf{A}\mathbf{x}$$

can be solved using x = Qu where Q is the matrix that diagonalises A and u is the solution to $u' = \Lambda u$ where Λ is the diagonal similarity transformation of A.

If A is diagonalisable, then for x' = Ax:

$$\boldsymbol{x}(t) = c_1 e^{\lambda_1 t} \boldsymbol{q}_1 + c_2 e^{\lambda_2 t} \boldsymbol{q}_2 + \dots + c_n e^{\lambda_n t} \boldsymbol{q}_n$$

For the higher-order linear differential equation:

$$x^{(n)} + a_1 x^{(n-1)} + \dots + a_{n-1} x' + a_n x = 0$$

define

$$x_1 = x, \; x_2 = x', \; \dots, \; x_n = x^{(n-1)}$$

and let

$$m{x} = egin{bmatrix} x_1 \\ x_2 \\ \dots \\ x_n \end{bmatrix}.$$

Then solve the following ODE using diagonalisation:

$$\frac{\mathrm{d}}{\mathrm{d}t} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \\ -a_n & -a_{n-1} & -a_{n-2} & \cdots & -a_1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}.$$

Vector Operations

Norm of a vector:

$$\| \boldsymbol{v} \| = \sqrt{v_1^2 + v_2^2 + \dots + v_n^2}$$

Unit vector:

$$\hat{m{v}} = rac{m{v}}{\|m{v}\|}$$

Dot product:

$$\begin{aligned} \boldsymbol{v} \cdot \boldsymbol{w} &= v_1 w_1 + v_2 w_2 + \dots + v_n w_n \\ &= \|\boldsymbol{v}\| \|\boldsymbol{w}\| \cos \left(\theta\right) \end{aligned}$$

Cross product:

$$\begin{aligned} \boldsymbol{v} \times \boldsymbol{w} &= \begin{vmatrix} \hat{\boldsymbol{i}} & \hat{\boldsymbol{j}} & \hat{\boldsymbol{k}} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} \\ &= \|\boldsymbol{v}\| \|\boldsymbol{w}\| \sin(\theta) \hat{\boldsymbol{n}} \end{aligned}$$

2-d Inverse:

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

Vector Space Axioms

Closure under addition:

$$\boldsymbol{u} + \boldsymbol{v} \in V$$

Commutativity of vector addition:

$$u + v = v + u$$

Associativity of vector addition:

$$u + (v + w) = (u + v) + w$$

Additive identity:

$$u + 0 = u$$

Additive inverse:

$$\boldsymbol{u} + (-\boldsymbol{u}) = \boldsymbol{0}$$

Closure under scalar multiplication:

$$k\mathbf{u} \in V$$

Distributivity of vector addition:

$$k\left(\boldsymbol{u}+\boldsymbol{v}\right)=k\boldsymbol{u}+k\boldsymbol{v}$$

Distributivity of scalar addition:

$$(k+m)\mathbf{u} = k\mathbf{u} + m\mathbf{u}$$

Associativity of scalar multiplication:

$$k(m\mathbf{u}) = (km)\mathbf{u}$$

Scalar multiplication identity:

$$1u = u$$

Subspaces

Subspaces of \mathbb{R}^2 : $\{0\}$, lines through the origin, and \mathbb{R}^2 .

Subspaces of \mathbb{R}^3 : $\{0\}$, lines through the origin, planes through the origin, and \mathbb{R}^3 .

Subspaces of M_{nn}: Upper triangular matrices, lower triangular matrices, diagonal matrices, and M_{nn} .

Determinant Properties

- 1. $\det(1) = 1$
- 2. Exchanging two rows of a matrix reverses the sign of its determinant
- 3. Determinants are multilinear, so that

$$\begin{vmatrix} a+a' & b+b' \\ c & d \end{vmatrix} = \begin{vmatrix} a & b \\ c & d \end{vmatrix} + \begin{vmatrix} a' & b' \\ c & d \end{vmatrix}$$

and

$$\begin{vmatrix} ta & tb \\ c & d \end{vmatrix} = t \begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

- 4. If **A** has two equal rows, then $\det(\mathbf{A}) = 0$
- 5. Adding a scalar multiple of one row to another does not change the determinant of a matrix
- 6. If \mathbf{A} has a row of zeros, then $\det(\mathbf{A}) = 0$
- 7. If **A** is triangular, then $\det(\mathbf{A}) = \prod_{i=1}^{n} a_{ii}$
- 8. If \mathbf{A} is singular, then $\det(\mathbf{A}) = 0$
- 9. $\det(\mathbf{A}\mathbf{B}) = \det(\mathbf{A})\det(\mathbf{B})$
- 10. $\det(\mathbf{A}^{\top}) = \det(\mathbf{A})$

Matrix Identities

- 1. A(BC) = AB + AC
- 2. $(\boldsymbol{A} + \boldsymbol{B})^{\top} = \boldsymbol{A}^{\top} + \boldsymbol{B}^{\top}$
- 3. $(\boldsymbol{A}\boldsymbol{B})^{\top} = \boldsymbol{B}^{\top}\boldsymbol{A}^{\top}$
- 4. If \boldsymbol{A} and \boldsymbol{B} are both invertible:

(a)
$$(AB)^{-1} = B^{-1}A^{-1}$$

(b)
$$(\mathbf{A}^{-1})^{\top} = (\mathbf{A}^{\top})^{-1}$$
